This document provides reference data for all Bethe logarithms of hydrogenic bound states with principal quantum numbers $n \leq 200$. The calculation is carried out for nonrelativistic hydrogenic Rydberg-state wave functions. The values are provided for each angular momentum l , in increasing order of the principal quantum number n , starting from $n = l + 1$.

A single table is used, which is continued on a number of pages. All the 20100 hydrogenic bound states with principal quantum numbers $n \leq 200$ are treated.

The numerical data are provided with an accuracy of nine decimals. All decimal figures shown in the table are significant.

The size of the following table is somewhat lengthy. In view of the lack of analytic expressions for the Bethe logarithm of excited hydrogenic states, there is currently no replacement for an explicit listing of all relevant values, if one would like to reliably understand radiative corrections for hydrogenic Rydberg levels with principal quantum numbers $n \leq 200$.

One of the most comprehensive compilation of Bethe logarithm recorded so far in the literature has covered all principal quantum numbers up to $n \leq 20$ [see G. W. F. Drake and R. A. Swainson, *Phys. Rev. A* **41**, 1243 (1990)]. The motivation for extending the previously available calculations to higher principal quantum numbers is given by recent experiments and described in the accompanying e-print quant-ph/0504001.
